This is a human interleukin-1 beta convert: I enzyme apoptosis protease-6 (ICE LAP-6) polypeptide. The ICE LAP-6 poly, "pride and agoniats to the polypeptide can be used to induce apoptosis, e.g. as an antiviral or antitumour agent, control embryonic development and tissue homeostasis and the roles of such factors in dysfunction and disease. Antagonists which inhibit the activity of the ICE LAP-6 jolypeptide can be used to treat, Alzheimer's or Parkinson's disease, r'eumatoid arthritis, septic shock, sepsis, stroke, chronic, acute or cerrial nervous system of the associated with cardiovascular disease, polycystic kidney disease, apoptosis of endothelial cells in cardiovascular disease, degenerative liver disease, multiple sclerosis, cerebellar degeneration, ischaemic injury, myccardial infarction, acquired immundeficiency syndrome (AIDS), myelodysplastic syndrome, aplastic anaemia, male pattern baldness and head injury damage. They can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DLETRGSQALPLFISCLEDTGQDMLASFLRTNRQAGKLSKPTLENLTPVVLRPEIRKPEV 120

The present sequence is an alternative version of human Caspase-9 also known as interleukin-1 converting enzyme (ICE) LaP6 and Mch6. Caspases are a family of cystethe proteases, that participate in the initiation and execution of apoptosis. Caspases exist as pro-enzymes, activated by cleavage into a large and small subunit, occurring after specific cadavage into a large and small subunit, occurring after specific.

The present invention relates to a method for functional cloning of genes encoding proteins or enzymes involved in pro-eolytic cleavage. The invention is based on the use of caspase expression cassettes comprising the coding two caspase subunit. A fusion polypeptide comprising a first and a second caspase subunit, separated by a cleavage site not associated in nature, is useful for cloning gene encoding enzymes involved in proteolytic cleavage. An expression cassette containing fusion controlleration or metastases of a tumour cell line deficient in an enzyme of interest and is also useful for diangeness of a containing fusion controlleration or metastases of a tumour cell characterised by coverexpression of a polypeptide (e.g. Cathepsin B or urokinase, celectively expressed in the tumour cells). DNA encoding fusion polypeptide is used in gene therapy.

Note: This sequence SEQ.ID.NO.18 is stated as being the same as that shown in page 195-107 (See AABE0620) in the specification. However these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    LRPETPRPVDIGSGGFGDVGALESLRGNADLAYILSMEPCGHCLIINNVNFCRESGLRTR 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Rev-caspages are cysteine proteases that specifically cleave proteins after Asp residues and is expressed as a zymogen, in which the small subunnit is N-terminal to a large subunit. A gene delivery vehicle comptising a rev-caspase coding sequence is useful for the treatment of cancer, where the gene delivery vehicle is internalised by tumour cells. The gene delivery vehicle can also be used to treat autoimmune diseases. Cells transfected with a rev-caspase expressing vector can be used in identification of inhibitors or enhancers of caspase-mediated apoptosis. In vitro translated rev-caspase can be used to identify an inhibitor or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 enhancer of caspase processing activity. Caspase inhibitors are useful for treating neurodegenerative diseases as well as for inhibiting apoptosis in the heart following myocardial infarction. Sequences AAA81217 -AAX81226 represent human caspase genes encoding caspase 1-10 gene products (AAY21715-Y2174).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           258 VSVEKIVNIFNGTSCPSLGGKPKLFFIQACGGEQXDHGFEVASTSPEDESPGSNPEPDAT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0
                                                                                                                                                                                                                                                                                                                                                              The present invention provides the protein and coding sequences of human rev-caspase.3, uncleavable rev-caspase.3 and rev-caspase.6. The sequences can be used in the gene therapy of cancer a ad autoimmune diseases. The present sequence is a protein described in the exemplification of the invention.

This is an amino acid sequence variant of human interleukin-1 beta converting enzyme apoptosis protease-6 (ICE LAP-6) polypeptide. The ICE LAP-6 polypeptide and agonists to the polypeptide can be used to induce apoptosis, e.g. as an antiviral or antitumour agent, control embryonic development and tissue homeostasis and the roles of such factors in dysfunction and disease. Antagonists which inhibit the activity of the ICE LAP-6 polypeptide can be used to treat Alzheimer's or Parkinson's disease, rheumatoid arthritis, septic shock, sepsis, stroke, chronic, acute or central nervous system inflammation, osteoporosis, ischaemia reperfusion injury, cell dearh associated with cardiovascular disease, polycystic kidney disease, apoptosis of endothelial cells in cardiovascular disease, degenerative liver disease, multiple sclerosis, cerebellar degeneration, ischaemic injury, myocardial infarction, acquired immunodeficiency syndrome (AIDS), myelodysplastic syndrome, aplastic annemia, male pattern baldness and head injury damage. They can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              332 ISSLPTPSDIFVSYSTFPGFVSWRDPKSGSWYVETLDDIFEQWAHSEDLQSLLLRVANAV 391

products, useful for modulating apoptosis for the therapeutic treatment of human diseases, e.g. cancers, autoimmune disease, Alzheimer's disease or Parkinson's apoptotic genes and their apoptotic protease

Claim 2; Fig 1; 36pp; English

The invention relates to an isolated gene encoding apoptic protease, mammalian ced-3 homologue 6 (Mch6). Mch6 is a member of the aspartate-specific cysteine protease (ASCP) family. Mch6 DNA and protein sequences are useful for modulating apoptosis for the therapeutic treatment of human diseases. Mc. 6 sequences are useful for upregulating apoptosis (e.g. for treating cancers, autoimmune disease or viral infections) or downregulating apoptosis (e.g. for treating Alaheimer's disease. Parkinson's disease or cerebellar degeneration). The Mch6 sequence is useful for diagnosing, treating or reducing the severity of cell death-mediated diseases, as well as other diseases mediated by either increased or decreased programmed cell death. The present amino acid sequence is Mch6.

2001-540372/60 N-PSDB; AAH77927 Identifying mammalian homolog ced-3 homolog (Mch)6 activity modulators, useful for treating lymphomas, carcinomas and hormone dependent tumours, Altheimer's disease, Parkinson's disease, comprises using Mch6 polypeptide

Example 1; Fig la-c; 36pp; English.

The present sequence represents a human Mch6 polypeptide. Mch6 is a ced-3 homologue, and is a member of the ICE (interleukin-1-beta converting processes (ASCPs). The specific cysteine proteases (ASCPs). The specification describes a method for identifying mammalian Mch6 activity modulators (inhibitors or enhancers). The compounds identified by the modulators (inhibitors or enhancers). The compounds identified by the modulators (inhibitors or enhancers). The compounds identified by the modulators (inhibitors or enhancers) and the set is set in its sease. Parkinson's disease, amyotropic lateral sclerosis, retinitis pigmentosa, or cereballar degeneration, myelodysplastic syndromes such a splastic anemia, ischemic injury including myocardial infarction, stroke and reperfusion injury. The compounds are also useful for treating diseases characterized by loss of apoptotic cell death such seach as cancers, e.g. lymphomas, carcinomas and hormone dependent tumours such as breast, prostate and ovarian cancer. Increased cell survival or system in lupus erythematosus and immune-mediated glomerulonephritis as well as viral infections such as herpes virus, pox virus and adenovirus and the novel identified compounds are useful for treating these conditions. The Mch6 inhibitors are used to treat or to reduce severity of diseases characterized by increased programmed cell death.

Mch6 is an aspartate-specific cysteine protease. Mch6 polypeptides and polynucleotides can be used to diagnose, treat or reduce the severity of cell death-mediated conditions, e.g. cancers, autoimmune diseases such as systemic lupus erythematos:s, viral infections such as herpesvirus, degenerative disorders such as Alzheimer's disease and Parkinson's disease, myelodysplastic syndromes such as myocardial infarction and stroke. They can also be used to screen for compounds that inhibit or promote Mch6 mediated apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isolated gene encoding a human apoptotic protease known as Mch6, useful in the diagnosis or treatment of cell death-mediated conditions, e.g. cancers and autoimmune diseases such as systemic lupus erythematosus -

```
homologue 6) an aspartate-specific cysteine protease and the MCH6 polypeptide. The MCH6-encoding nucleic acids and polypeptides can be used to diagnose, treat (e.g. by gene therapy) or reduce the severity of cell death-mediated diseases (i.e. apoptoric) such as neurodegenerative diseases e.g. Alzheimer's disease, Parkinson's disease, amyotrophic diseases e.g. Alzheimer's disease, Parkinson's disease, amyotrophic myelodysplastic syndromes, e.g. aplastic and cerebellar degeneration, and myocardial infarction, stroke and reperfusion injury. The MCH6-encoding nucleic acids and polypeptides can also be used to diagnose or generate reagents to diagnose diseases mediated or characterised by programmed cell death. A purified recombinant MCH6 protein can be used to measure hydrolysis rates for various substrates such as DEVD-AMC and YVAD-AMC in

The invention relates to determining a prognosis for survival for a cancer patient. The method involves (a) measuring a level of a tumour upcreduced CARD-containing antagonist of caspase-9 (TUCAN) in a neoplastic cell-containing sample to a reference level of TUCAN, where a low level of TUCAN in the sample correlates with increased survival of the patient. Alternatively, the method involves measuring levels of TUCAN and one or more biomarkers selected from the group of CIAP2, Apatl, Bel-2, or smc in a neoplastic cell-containing sample from the cancer patient. The method is useful for determining if the patient is at risk for relapse, or for determining a proper course of treatment for a patient with cancer. The method is also useful for monitoring the effectiveness of a course of treatment for a patient with cancer, e.g. colon cancer, cancer, cancer, cancer, lung cancer, leukemia, CNS cancer, melanoma, prostate cancer, ovarian cancer, lung cancer, leukemia, CNS cancer, melanoma, prostate cancer, or renal cancer. The present sequence represents a human caspase-9 polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    281

The present amino acid sequence is human Caspase-9 also known as interleukin.1 converting enzyme (ICE) LAP6 and Mch6 Caspases are a family of cysteme proteases, that participate in the initiation and execution of apoptosis. Cappases exist as pro-enzymes, activated by cleavage into a large and small subunit, occurring after specific aspartic acid residues within the pro-enzyme sequence.

The present invention relates to a method for functional cloning of genes are apparent invention is based on the use of caspase expression cassettes comprising the coding sequence of a protecity cleavage site flanked by sequences encoding two caspase subunits. A fusion polypeptide comprising a first and a second caspase subunits. A fusion polypeptide comprising a first in mature, is useful for cloning gene encoding enzymes involved in protecity cleavage site not associated in nature, is useful for cloning gene encoding enzymes involved in protecity collevage. An expression cassette containing fusion enzyme of interest and is also useful for diagnosis and suppression of protecting of a tumour cell characterised by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                290 EQKDHGFEVASTSPEDESPGSNPEPDATPFQEGLRTF0QLDAISSLPTPSDIFVSYSTFP 349

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 selectively expressed in the tumour cells). DNA encoding fusion polypeptide is used in gene therapy.

Note: This sequence SEQ.10.NO.18 is stated as being the same as that shown in Figure 18 (See AAE00606) in the specification. However these sequences differ at several positions.
                                                                                                                                                         Novel fusion polypeptide comprising first and second caspase subunit separated by cleavage site not associated in nature with caspase subunit, useful for cloning gene encoding enzymes involved in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                overexpression of a polypeptide (e.g. Cathepsin B or urokinase,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match 30.5%; Score 127; DB 22; Length 266; Best Local Similarity 100.0%; Pred. The invention relates to an isolated intracellular signaling polypeptide, termed Nod2, comprising a sequence of 1007 or 1040 amino acids, given in the specification. The nucleic acid encoding the isolated protein is useful for identifying subjects at risk of developing Crohn's disease by providing a nucleic acid from the subject, where the nucleic acid comprises a Nod2 gene and detecting the presence or absence of one or more variations in the Nod2 gene Detecting comprises comparing the sequence of the nucleic acid to be sequence of a wild-type Nod2 nucleic acid. Detection is accomplished by hybridisation analysis. The method acid betterion is accomplished by hybridisation analysis. The method curther comprises determining if the subject is at risk of developing Crohn's disease based on the presence or absence of the variations and detectably a genotype relative risk or a population attributable risk or the subject. The variation is a polymorphism or a mutation causes a preferably a cytosine residue insertion, where the mutation causes a preferably a cytosine residue insertion, where the mutation as selected from the sequences of the Nod2 gene. The isolated protein is useful as a compared for accepting drugs that can alter, for example, RICK signaling, and thus the physiological effects of Mr. kappa B. The Nod2 gene is useful for producing the isolated protein by recombinant techniques, as starting nucleic acids for directed evolution, for gene therapy, or to decrease the level of Nod2 protein or mRNA in transgenic plants, plant tissues, or plant cells as compared to wild-type plants, plant tissues or plant cells. This sequence represents a Nod2 related protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 MDEADRRLLRRCRLRLVEELQVDQLWDVLLSRELFRPHMIEDIQRAGGGSRRDQARQLII 60

Inhibiting or increasing programmed cell death of a cell, for treating e.g. cancer, comprises upregulating or inhibiting, respectively, the expression or activity of basic transcription factor (BTF) or its BTP3; cell death; apoptosie; basic transcription factor; cytostatic; nootropic; neuroprotective; antiparkinsonian; antiarteriosclerotic; antirheumatic; antiarthritic; gene therapy; CARD; Mch6. Examples; Fig 2B; 84pp; English. Witze E; 21-MAY-2002; 2002WO-US16230. 21-MAY-2001; 2001US-292559P

The invention relates to inhibiting or increasing programmed cell death of a cell. The method involves upregulating 'r inhibiting, respectively, the expression or activity of basic transcription factor (BFF) as its homologue in the cell. The BFF3 polypeptides and nucleic acids are useful for inhibiting or increasing programmed cell death. They are used for screening for an agent that increases or inhibits programmed cell death or pre-screening for an agent that modulates programmed cell death. The screening for an agent that modulates programmed cell death. The screening or treating cancer or inhibits programmed cell death, is used for diagnosing or treating cancer or neurodegenerative diseases (e.g. amyotrophic lateral sclerosis, Alzheimer's disease, Parkinson's disease or multiple sclerosis), atheroscilerosis, or rheumatoid arthritis. Sequences ABP71124-135 represent peptide fragments various CARD proteins.

```
The invention relates to inhibiting or increasing programmed cell death of a cell. The method involves upregulating or inhibiting, respectively, the expression or activity of basic transcription factor (BFF) as it is homologue in the cell. The BFFP polypeptides and nucleic acids are useful for inhibiting or increasing programmed cell death. They are used for screening for an agent that increases or inhibits programmed cell death or pre-acceening for an agent that modulates programmed cell death. The screened agent that increases or inhibits programmed cell death, is used for diagnosing or treating cancer or neurodegenerative diseases (e.g. amyotrophic lateral sclerosis, Altheimer's disease, Parkinson's disease or multiple sclerosis, latheimer's disease, Parkinson's disease or multiple sclerosis), arherosclerosis, or rheumatoid arthritis.

invention relates to nucleic acid molecules encoding rev-caspases

6; 74pp; English

Disclosure; Fig

```
Rev-caspases are cysteine proceases that specifically cleave proteins after Asp residues and is expressed as a zymogen, in which the small subtunit is a Neterminal to a large subunit. A gene delivery vehicle comprising a rev-caspase coding sequence is useful for the treatment of cancer, where the gene delivery vehicle is neternalised by tumour cells. The gene delivery vehicle is neternalised by tumour cells. The gene delivery vehicle can also be used or treat autoimmune diseases. Cells transfected with a rev-caspase expressing vector can be used in identification of inhibitors or enhancers of caspase-mediated apoptosis in vitro translated rev-caspase can be used to identify an inhibitor or enhancer of caspase processing activity. Caspase inhibitors are useful for treating neurodegenerative diseases as well as for inhibiting apoptosis in the heart following myocardial infarction. Sequences ANY21734 -AAV21795 represent conserved peptide sequences in various
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New apoptotic genes and their apoptotic protease products, useful for modulating apoptosis for the therapeutic treatment of human diseases, e.g. cancers, autoimmune disease, Alzheimer's disease or Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated gene encoding apoptic protease, mammalian ced-3 homologue 6 (Mch6). Mch6 is a member of the aspartate-specific cysteine protease (ASCP) family. Mch6 DNA and brotein sequences are useful for modulating apoptosis for the therapeutic treatment of human diseases. Mch6 sequences are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Apoptic protease; mammalian ced-3 homologue 6; Mch6; cancer; aspartate-specific cysteine protease; ASCP; apoptosis; therapy; autoimmune disease; cerebellar degeneration; Albriemer a disease; cytostatic; Parkinson's disease; immunomodulator; antimicrobial; viral infection; cell death-mediated disease; neuroprotective.
                                                                                                                                                                                                                                                                                                                                                                                                               ..
                                                                                                                                                                                                                                                                                                                                                                     3.6%; Score 15; DB 20; Length 15; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides the protein and coding sequences of human rev-caspase-3, uncleavable rev-caspase-3 and rev-caspase-6. The sequences can be used in the gene therapy of cancer and autoimmune diseases. The present sequence is a peptide described in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New rev-caspases engineered to contain the small subunit fused in frame N-terminal to the large subunit, which is in reverse order to the wild type caspases, are useful to treat cancer and autoimmune diseases
for upregulating apoptosis (e.g. for treating cancers, autoimmune disease or viral infections) or downregulating apoptosis (e.g. for treating Alzheimer's disease, Parkinson's disease or cerebellar degeneration). The Mch6 sequence is useful for diagnosing, treating or reducing the severity of cell death-mediated diseases, as well as other diseases mediated by either increased or decreased programmed cell death. The present amino acid sequence is Mch6 peptide fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              mammalian ced-3 homologue 6 (MCh6). Mch6 is a member of the aspartate-specific cysteine protease (ASCP) family. Mch6 DNA and protein sequences are useful for modulating apoptosis for the therapeutic treatment of human diseases. Mch6 sequences are useful for upregulating apoptosis (e.g. for treating cancers, autoimmune disease or viral infections) or downregulating apoptosis (e.g. for treating Alzheimer's disease, parkinson's disease or cerebellar degeneration). The Mch6 sequence is useful for diagnosing, treating or reducing the severity of call death-mediated diseases, as well as other diseases mediated by either increased or decreased programmed cell death. The present amino acid sequence is Mch6 peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated gene encoding apoptic protease,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         protease) peptide or polypeptide. The Omi peptide specifically binds to a portease) peptide or polypeptide. The Omi peptide specifically binds to a rinduces capase independent apoptosis, or fails to have serine protease activity. The Omi peptides are useful for regulating or altering apoptosis, specifically caspase-mediated apoptosis, and as immunogens for raising antibodies. Enhancers of apoptosis are useful for treating cancers, tumours or for destroying cells that mediate autoimmune diseases. Compositions may also be used for the treatment of diseases. Sasociated with inappropriate activation of apoptosis such as neurodegenerative diseases and ischaemic injury. The antibodies can be used in isolating Omi peptides, polypeptides and their variants, in identifying molecules that interfact with Omi peptides and polypeptides and in inhibiting or enhancing the biological activity of Omi peptides and polypeptides. Gardennez ABPP11315 represent fragments of various in polypeptides. Sequences ABPP11315 represent fragments of various in Pabinding proteins, used to determine Omi as a lap-binding protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            . 0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New Omi nucleic acids and peptides that bin o an inhibitor of apoptosis proteins, useful for regulating or altering caspase-mediated apoptosis and for treating cancer, tumor, o: autoimmune diseases

```
homologue 6) an aspartate-specific cysteine proteage and the MCH6

Co polypeptide. The MCH6-encoding nucleic acids and polypeptides can be used

Co diagnose, treat (e.g. by gene therappy) or reduce the severity of cell

Coath-mediated diseases (i.e. apoptotic) such as neurodegenerative

Cd diseases e.g. Alzheimer's disease, Parkinson's disease, amyotrophic

Cd lateral sclevosis, retinitis pigmentosa and cerebellar degeneration, and

myelodysplastic syndromes, e.g. aplastic anaemia, ischaemic injury,

myocardial infarction, stroke and reperfusion injury. The MCH6-encoding

Cm myelodysplastic syndromes and passing the moderation or generate

Cr angents to diagnose diseases mediated or characterised by programmed

cell death. A purified recombinant MCH6 protein can be used to measure

Chydrolysis rates for various substrates such as DEVD-AMC and YVAD-AMC in

a continuous fluorometric assay. The present sequence represents a

conserved sequence from human MCH6 indicating that MCH6 is a member of

the Ced-like subfamilly of proteases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated gene encoding MCH6 (mammalian ced-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Caspase-1; Spodoptera frugiperda; Sf; insect; nuclear immunophilin;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            proteins, angiopoletin, apoptosis related proins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinases, colony stimulating factors, interferons, interleukins, G-protein coupled receptors and thioesterases. The present sequence is a peptide encoded by one such oligonucleotide. The oligonucleotides and the peptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autonimmune diseases (e.g. rheumatoid and Grave, s disease), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, leukaemia), diseases of the nervous system and an infection of pathogenic organisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to oligonucleo ides (see AAL26793-AAL34659) encoding polymorphic variants of proteins re ited to amylases, amyloid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; aspartate-specific cysteine protease; MCH6; nootropic;

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
genes from Drosophila and for elucidating cell signalling and cell-cell interactions \cdot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL6175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and insecticides, therapeutics in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL0151-ABL30511), expressed DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Drosophila; developmental biology; cell signalling; insecticide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                             can be used for the recombinant production of the protein. The products can be used for screening for compounds which can inhibit or enhance (aspase-1 activity and which can be used to inhibit or enhance, respectively, apoptosis. The Caspase-1 can also be used to identify proteins which are processed by it. The products can also be used for the production of antibodies and for the production of transgenic
                                                                                                                                                                                                                                                                                                                                                                           This represents a Caspase-1 pro-enzyme, a novel Spodoptera frugiperda (Sf) insect cell nuclear immunophilin which belongs to the CED-3 subfamily of aspartate-specific cysteine proteases (ASCPs). A host cell containing an expression vector comprising the Caspase-1 nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid detection reagent for detecting 1000 or more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                Isolated aspartate-specific cysteine protease, Caspase-1 - obtained from Spodoptera frugiperda, used to develop screening assays for compounds which can inhibit or enhance apoptosis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to inhibiting or increasing programmed cell death of a cell. The method involves upregulating or inhibiting, respectively, the expression or activity of basic transcription factor (BFF) and its homologue in the cell. The BFF3 polypeptides and nucleic acids are useful for inhibiting or increasing programmed cell death. They are used for screening for an agent that increases or inhibits programmed cell death or pre-screening for an agent that modulates programmed cell death. The screened agent that increases or inhibits programmed cell death. The screened agent that increases or inhibits programmed cell death, is used for diagnosing or treating cancer or neurodegenerative diseases (e.g. amyotrophic lateral sclerosis, Albehamer's disease, Parkinson's disease or multiple sclerosis), atheroscalerosis, or rheumatoid arthritis. Sequences ABP71106-121 represent CARD regions of various CARD proteins.

                                                                                                                                                                                                                                                                                                     probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow bone marrow which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human peptide encoded by genome-carived single exon probe SEQ ID 27772.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                   The present invention provides a number of single exon nucleic acid

comprising (a) identifying exons, row above and (b) measuring the expression of each of the exons in several tissues and/or cell types using hybridisation to a single exon in several microarrays having a probe with the exon, where a common pattern of expression of the exons in the tissues and/or cell types indicate; that the exons should be assigned to a single gene; a peptide comprising one of 12011 sequences, mentioned in the specification, or encoded by the probes/open reading frames (ORP). The probes are used for gene expression analysis, and for identifying exons in a gene, particularly using human lung derived mRNA and for the study of lung diseases (COPD), interstitial lung disease (LD), familial idiopathic pulmonary disease.

Cibrosis, neurofibromatosis, tubberous sciences additionary disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       nucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung mRNA, and (b) measuring the label detectably bound to each probe of the array; identifying exons in a eukaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single gene,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their opphements or the 12819 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes; the novel set of probes; the novel set of probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        haemosiderosis, pulmonary histiocytosis, lymphangioleiomyomtosis, pulmonary alveclar proteinosis, Raragener syindrome, fibrocystic pulmonary alveclar proteinosis, Raragener syindrome, fibrocystic pulmonary dysplasia, primary ciliary dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a peptide/protein encoded by a single exon probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic
familial idiopathic pulmonary fibrosis, neurofibromatosis; tubercus sclerosis; daucher's disease; tubercus sclerosis; Gaucher's disease; Niemann-Ptok disease; pulmonary-Pudlak syndrome; sarcoidosis; pulmonary haemosiderosis; pulmonary histiocytosis; lymphangioleiomyomtosis; Karagener syndrome; pulmonary alveolar proteinosis; fibrocystic pulmonary dyspiasia; pulmonary alveolar proteinosis; fibrocystic pulmonary dyspiasia; hyaline membrane disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      acid probes, used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Spatially-addressable set of single exon nucle

Apototic protease Mch3-alpha

(first entry)

05-AUG-1997

AAW15262;

```
A proenzyme (AAM15247) is activated to CMH-1, or CPP32/PGD2
homologue-1, a human cysteine protease that is involved in
apoptosis. Its amino acid sequence was deduced from a full-length
isolated cDNA clone (AAT66970). Active, activatable (i.e. proenzyme)
or inactivated forms of CMH-1 can be expressed in prokaryotic or
eukaryotic host cells. The polypeptides are useful for screening
potential apoptosis inhibitors and for raising ibodies used to
assay CMH-1, to regulate cholesteroi levels, in bit CMH-1 activity
and therefore apoptosis, and to purify CMH-1 polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA encoding active, activatable or inactive cysteine protease CMH-1 - useful in gene therapy for promoting and inhibiting apoptosis and for diagnosing cells with potential for apoptosis
                                                                                                                    Cysteine protease; CMH-1; CPP32/Mch2 homologue-1; apoptosis; programmed cell death; cancer; neurodegenerative disease; autoimmune disease; gene therapy; diagnosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human Mch3-alpha (AAW15262) is an apoptotic protein and novel member of the interleukin-1-beta converting enzyme (ICE) family of cysteine proteases. Its amino acid sequence was deduced from a CDNA clone (AAT66992) obtd. from a Jurkat library. Mch3-beta (AAW15263) has also been identified that lacks the active site of Mch3-alpha. Mch3-alpha polypeptides can be produced in engineered host cells and used to treat human diseases associated with cell death, such as AIDS, ischaemic injury, neurodegenerative diseases, etc. They can also be used to regulate apoptosis and to screen for Mch3 agonists and antagonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New gene encoding Mch3, a cysteine protease that regulates apoptosis - for treating human diseases associated with apoptosis, and screening for antagonists and agonists of Mch3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ..

A gene delivery vehicle comprising a rev-caspase coding sequence is useful for the treatment of connex, where the gene delivery vehicle is internalised by tumour cells. The gene delivery vehicle can also be used to that autoimmune diseases. Cells transfected with a rev-caspase expressing vector can be used in identification of inhibitors or enhancers of caspase-mediated apoptosis. In vitro translated rev-caspase can be used to identify an inhibitor or enhancer of caspase processing activity. Caspase inhibitors are useful for treating neurodegenerative diseases as well as for inhibiting apoptosis in the heart following myocardial infarction. Sequences AAX81217 -AAX81226 represent human caspase ceres encoding caspase 1-10 gene products (AAY21715-Y21724).
                                                                                                                                                                                                                                                                            Rev-caspase; cysteine protease; zymogen; caspase; cancer; gene therapy; autoimmune disease; caspase-mediated apoptosis; neurodegenerative; tumour cell; myocardial infarction; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to nucleic acid molecules encoding rev-caspases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acid molecule encoding a rev-caspase - used for screening and identifying inhibitors or enhancers for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

The present amino acid sequence is human Caspase-7 also known as interleukin-1 converting enzyme (ICE) LAR3, CHM-1 and Mhc3. Caspases are a family of cysteine proteases, that participate in the initiation and execution of apoptosis. Caspases exist as pro-enzymes, activated by cleavage into a large and small subunit, occurring after specific aspartic acid residues within the pro-enzyme sequence.

The present invention relates to a method for functional cloning of genes encoding proteins or enzymes involved in proteolytic cleavage. The encoding sequence of a proteolytic cleavage site nor assettes comprising the coding sequence of a proteolytic cleavage site flanked by sequences concoding two caspase subunits. A flusion polypeptide comprising a first and a second caspase subunit. A flusion polypeptide comprising a first can a second caspase subunit. A flusion polypeptide comprising a first of an axerue, is useful for cloning gene encoding enzymes involved in proteolytic cleavage. An expression cassette containing fusion caryme of interest and is also useful for diagnosis and suppression of proliferation or metastases of a tumour cell characterised by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                Human, caspase-7; interleukin-1 converting enzyme; ICE-LAP3; CHM-1; Mhc3; cysteine protease; apoptosis; caspase expression cassette; metastasis; tumour; cathepsin B; urokinase; proliferation; gene therapy.

The present invention describes a compound (1) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding caspase 7, which specifically hybridises with and inhibits the expression of caspase 7. (1) has antiinflammatory and cytostatic activities, and can be used in antieense therapy and as an inhibitor of caspase 7 expression. (1) is useful for inhibiting the expression of caspase 7 expression. (1) is useful for inhibiting a disease or condition associated with caspase 7 including inflammatory condition, hyperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (1) is useful for diagnostics, therapeutics, prophylaxis and as research reagent and kits. (1) is useful prophylactically to prevent or delay infection, inflammation or tumour formation. The present or example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                     Novel antisense compounds targeted to nucleic acids encoding caspase for modulating gene expression and treating diseases associated with expression of caspase 7 in humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Caspase 7, antisense modulation, antiinflammatory, cytostatic, antisense therapy, caspase 7 inhibitor; inflammatory condition, hyperproliferative disorder; cancer; bone metabolism; infection; cholesterol disorder; inflammation; tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .;

The present invention describes a compound (I 8-50 nucleobases in length targeted to a nucleic acid molecule en oding capase 7, which specifically hybridises with and inhibits the expression of caspase 7.

(I) has antiinflammatory and cytostatic activities, and can be used in antisense therapy and as an inhibitor of caspase 7 expression. (I) is useful for inhibiting the expression of caspase 7 in human cells or tissues, and for treating a human having a disease or condition.

C tissues, and for treating a human having a disease or condition, hyperproliferative disorder (cancer), or bone metabolism or cholesterol chiscorder. (I) is useful for diagnostics, therapeutics, prophylaxis and as research reagent and kits. (I) is useful prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence represents a human capase? 7 protein, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel antisense compounds targeted to nucleic acids encoding caspase 7, for modulating gene expression and treating diseases associated with expression of caspase 7 in humans
                    al antisense compounds targeted to nucleic acids encoding caspase 7, modulating gene expression and treating diseases associated with ression of caspase 7 in humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Caspase 7; antisense modulation; antiinflammatory; cytostatic; antisense therapy; caspase 7 inhibitor; inflammatory condition; hyperproliferative disorder; cancer; bone metabolism; infection; cholesterol disorder; inflammation; tumour.

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher uskaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DN sequences (ABL/6176-ABL/30511), expressed DNA sequences (ABL/6175) and the encoded proteins
epecifically hybridises with and inhibits the expression of caspase 7. (I) has antiniflammatory and cytostatic activities, and can be used in antisense therapy and as an inhibitor of caspase 7 expression. (I) is useful for inhibiting the expression of caspase 7 expression. (I) is tissues, and for treating a human having a disease or condition associated with caspase 7 including inflammatory condition, hyperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (I) is useful for diagnostics, therapeutics, prophylaxis and as research reagent and kits. (I) is useful prophylactically to prevent or delay infection, inflammation or tumour formation. The present esquence represents a mouse caspase 7 protein, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (ABBS7737-ABB72072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Drosophila; developmental biology; cell signalling; insecticide;

The present invention describes a compound (1) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding caspase 7, which specifically phybridises with and inhibits the expression of caspase 7. (I) has antiinflammatory and cytostatic activities, and can be used in antisense therapy and as an inhibitor of caspase 7 expression. (I) is useful for inhibiting the expression of caspase 7 in human cells or tissues, and for treating a human having a disease or condition associated with caspase 7 including inflammatory condition, hyperproliferative disorder (cancer), or bone metabolism or cholesterol disorder. (I) is useful for diagnostics, therapeutics, prophylaxis and as research reagent and kits. (I) is useful prophylactically to prevent or delay infection, inflammation or tumour formation. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel antisense compounds targeted to nucleic acids encoding caspase for modulating gene expression and treating diseases associated with expression of caspase 7 in humans
                                                                                                                                                                                                                                             Caspase 7; antisense modulation; antiinflammatory; cytostatic; antisense therapy; caspase 7 inhibitor; inflammatory condition; hyperproliferative fasorder; cancer; bone metabolism; infection; cholesterol disorder; inflammation; tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match 2.4%; Score 10; DB 23; Length 340; Best Local Similarity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a compound (1) 8-50 nucleobases in length targeted to a nucleot acid molecule encoding caspase 7, which specifically hybridises with and inhibite the expression of caspase 7. (1) has antiinflammatory and cytostatic activities, and can be used in antisense therapy and as an inhibitor of caspase 7 expression. (1) is useful for inhibiting the expression of caspase 7 in human cells or tissues, and for treating a human having a disease or condition associated with caspase 7 including inflammatory condition, hyperproliferative disorder (cancer), or bone metabolism or cholesterol chapter. (1) is useful for diagnostics, therapeutus, prophylaxis and as research reagent and kits. (1) is useful prophylactically to prevent or delay infection, inflammation or tumour formation. The present crample from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò.

This polypeptide comprises human LICE3, a novel cysteine protease having homology to interleukin-1 beta converting enzyme (ICE). Its amino acid sequence was deduced from a cDNA clone (see AAV26613) from a human foetal liver library. LICE3 has significant homology to a human foetal liver library. LICE3 has significant homology to apoptosis genes ICE and CED-3 and is most closely related to LICE2 (57% homology). The invention provides LICE3 nucleic acids, vectors and host cells for the expression of LICE. Also disclosed are LICE3 agonists and antagonists, and methods for treatment of disorders characterised by altered apoptosis. LICE3 agonists can be used to treat cancers by promoting apoptosis of tumour cells. LICE3 antagonists can be used to treat conditions resulting from the increased apoptosis, such as viral infections (e.g. ALDS), nervous system degeneration (e.g. Parkinson's disease, Alzheimer's disease) and autoimmume diseases. The products can also be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mch4, Mch5, aspartic acid specific Cys protease; cell apoptosis; stroke; increased cell survival; hormone dependent tumour; autoimmune disease; immunoglobulin mediated glomerulonephritis; degenerative disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This ICE-LAP-3 protein may be used therapeutically, e.g. as an antitumor or antiviral agent and to control embryonic development and tissue homeostasis. The protein can also be used to treat immunosuppression disorders, such as AIDS, by targeting virus infected cells for cell death. The DNA may find use in gene
            Human interleukin-I-converting enzyme-like apoptosis protease-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0

This invention describes novel human and mouse anti-apoptotic gene products which contain at least one death effector domain. The products of the invention are used in the treatment of HIV infections and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Rev-caspage; cysteine protease; zymogen; caspase; cancer; gene therapy; autoimmune disease; caspage-mediated apoptosis; neurodegenerative; tumour cell; myocardial infarction; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Rev-caspases are cysteine proteases that specifically cleave proteins after Asp residues and is expressed as a zymogen, in which the small subunit is N-terminal to a large subunit. A gene delivery vehicle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to nucleic acid molecules encoding rev-caspases.
                                                                                                                                                                                                             New DNA encoding for anti-apoptotic gene product - used to treat HIV infections and autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid molecule encoding a rev-caspase - used for screening and identifying inhibitors or enhancers for treating cancer or autoimmune disease
                                                                                                                                                                                                                                                                                                                                                                                                                                        Match 2.4%; Score 10; DB 19; Length 479; Local Similarity 100.0%; Pred. Caspases are a family of cysteine proteases, that participate in the initiation and execution of apoptosis Caspases exists as pro-enzymes, activated by cleavage into a large and small subunit, occurring after specific aspartic acid residues within the pro-enzyme sequence.
comprising a rev-caspase coding sequence is useful for the treatment of cancer, where the gene delivery vehicle is internalised by tumour cells. The gene delivery vehicle can also be used to treat autoimmune diseases. Cells transfected with a rev-caspase expressing vector can be used in identification of inhibitors or enhancers of caspase-mediated apoptosis. In vitro translated rev-caspase can be used to identify an inhibitor or enhancer of caspase processing activity. Caspase inhibitors are useful for treating neurodegenerative diseases as well as for inhibiting AAX81217 -AAX81226 represent human caspase genes encoding caspase 1-10 gene products (AAY21715-Y21724).

The present invention relates to a method for functional cloning of genes encoding proteins or enzymes involved in proteolytic cleavage. The invention is based on the use of caspase expression cassettes comprising the coding sequence of a proteolytic cleavage site flanked by sequences encoding two caspase subunits. A fusion polypeptide comprising a first and a second caspase subunit, separated by a cleavage site not associated in nature, is useful for cloning gene encoding enzymes involved in proteolytic cleavage. An expression cassette containing fusion profeolytic is used to identify a mutant cell line deficient in an enzyme of interest and is also useful for diagnosis and suppression of proliferation or metastases of a tumour cell characterised by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides the protein and coding sequences of human rev-caspases.3 and rev-caspase.6. The sequences can be used in the gene therapy of cancer and autoimmune diseases. The present sequence is a protein described in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New rev-caspases engineered to contain the small subunit fused in frame N-terminal to the large subunit, which is in reverse order to the wild type caspases, are useful to treat cancer and autoimmune diseases
                                                                                                                                                                                                      selectively expressed in the tumour cells). DNA encoding fusion polypeptide is used in gene therapy.

Note: This sequence SEQ.ID.NO.20 is stated as being the same as that shown in Pigure 20 (See AAE00607) in the specification. However these sequences differ at several positions.
                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          rev-caspase; gene therapy; protease; apoptosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is the human procease FMH-1, which is an interleukin-1 beta converting enzyme (ICE)/CED3-like protease. FMH-1 can be used to induce apoptoosis, while fragments may induce or inhibit apoptosis depending on which FMH-1 region they bind. Peptide mimetics or small molecule inhibitors targetted to used, e.g. to treat autoimmune disease, cancer and persistent infections, while its inhibition is used to treat mutoimmune, e.g. Alzheimer's, Parkinson's or Huntington's meurodegeneration, e.g. Alzheimer's, Parkinson's or Huntington's immunogenic antigens FMH-1 can also be used to generate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antibodies for therapeutic use by blocking binding of ligands to

The present sequence is human Caspase-10 alternative version, also known as Mch4. Caspases are a family of cysteine proteases, that participate in the initiation and execution of apoptosis. Caspases exist as pro-enzymes, activated by cleavage into a large and small subunit, occurring after specific aspartic acid residues within the pro-enzyme sequence. The present invention relates to a method for functional cloning of genes encoding proteans or enzymes involved in proteolytic cleavage. The invention is based on the use of caspase expression cassettes comprising the coding sequence of a proteolytic cleavage site flanked by sequences encoding two caspase subunits. A fusion polypeptide comprising a first and a second caspase subunit, separated by a cleavage site not associated in nature, is useful for cloning gene encoding enzymes involved in polypeptide is used to identify a mutant cell line deficient in an object of containing fusion of enzyme of interest and is also useful for diagnosis and suppression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Overexpression of a polypeptide (e.g. Cathepsin B or urokinase, selectively expressed in the tumour cells). DNA encoding fusion polypeptide is used in gene therapy. Note: This sequence SEQ.ID.NO.20 is stated as being the same as that shown in page 108-110 (See ARE00621) in the specification. However these sequences differ at several positions.
                                                                                                                                                                                                                                         Cysteine protease, apoptosis; caspase expression cassette; metastasis; tumour; cathepsin B.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to nucleic acid molecules encoding rev-caspares.

Rev-caspases are cysteine proceases that specifically cleave proteins after Asp residues and is expressed as a zymogen, in which the small stream as to a large subunit as N-terminal to a large subunit. A gene delivery vehicle comprising a rev-caspase coding sequence is useful for the treatment of comprising a rev-caspase coding sequence is internalised by tumour cells. The gene delivery vehicle is internalised by tumour cells. The gene delivery vehicle can also be used to treat autoimmune diseases.

Cancer, where the gene delivery vehicle is internalised by tumour cells. The gene delivery vehicle can also be used to treat autoimmune diseases. Can call transfected with a rev-caspase expressing vector can be used in identification of inhibitors or enhancers of caspase processing activity. Caspase inhibitors are useful for treating neurodegenerative diseases as well as for inhibiting apotosis in the heart following myocardial infarction. Sequences

New apoptotic genes and their apoptotic protease products, useful for modulating apoptosis for the therapeutic treatment of human diseases, e.g. cancers, autoimmune disease, Alzheimer's disease or Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated gene encoding apoptic protease, mammalian ced-3 homologue 6 (Mch6). Mch6 is a member of the apparate-specific cysteine protease (ASCP) family. Mch6 DNA and protein sequences are useful for modulating apoptosis for the therapeutic treatment of human diseases. Mch6 sequences are useful for upregulating apoptosis (e.g. for treating cancers, autoimmune disease or viral infections) or downregulating apoptosis (e.g. for treating Alzheimer's disease, Parkinson's disease or cerebellar degeneration). The Mch6 sequence is useful for diagnosing, treating or reducing the severity of cell death-mediated diseases, as well as other diseases mediated by either increased or decreased programmed cell death. The present amino acid sequence is Mch6 peptide fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                       aspartate-specific cysteine protease; ASCP; apoptosis; therapy; autoimmure disease; cerebellar degeneration; Alzheimer's disease; cytostatic; Parkinson's disease; immuromodulator; antimicrobial; viral infection; cell death-mediated disease; neuroprotective.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ·,

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                       US-09-961-201A-1

Sequence 116, Application US/10174105A

| Sequence 116, Application US/10174105A
| Publication No. US20030068652A1
| GENERAL INPORMATION:
| APPLICANT: Cell Signaling Technology, Inc.
| APPLICANT: CAMB. Michael J.
| TILLE OF INVENTION: POSITIVE IDENTIFICATION OF PHOSPHO-PROTEINS USING MOTIF-SPECIFIC
| TILLE OF INVENTION: CONTEXT-INDEPENDENT ANTIBODIES COUPLED WITH DATABASE SEARCHING
| FILLE REFERENCE: CST-138 CIP3
| CURRENT FILLING DATE: 2002-06-18
| PRIOR APPLICATION NUMBER: US 09/148,712
| PRIOR APPLICATION NUMBER: US 09/148,712
| PRIOR PLING DATE: 2000-03-24

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 38, Application US/09989903
Patent No. US20020146804A1
GENERAL INFORMATION.
APPLICANT: Alnemi, Emad S.
APPLICANT: Alnemi, Emad S.
TITLE OF INVENTION: CASPASE-14, AN APOTOTIC PF'-TEASE, NUCLEIC ACID ENCODING TILLE OF INVENTION: AND METHODS OF USE
TITLE OF INVENTION: AND METHODS OF USE
CURRENT APPLICATION NUMBER: US/09/989,903
CURRENT FILING DATE: 2002-04-11
NUMBER OF SEQ ID NOS. 78
SOFTWARE: Patentin Ver. 2.0
SEQ ID NO 38
LENGTH: 39
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
